

This feature allows you to redirect one domain to another domain. This is useful, for example, for temporarily redirecting visitors while a site is down for maintenance.

## How to setup a Domain Redirect in cPanel

1. Login to your cPanel control panel
2. Click on the "Redirects" icon

To add a redirect:

1. Use the pull-down menu to select the type of redirection needed—temporary or permanent.
  - The *Temporary 302* setting will not update the visitor's bookmarks.
  - The *Permanent 301* setting will notify the visitor's browser to update its records.
2. Enter the URL you would like to redirect, using the pull-down menu and corresponding text box.
  - You may use the *All Public Domains* option to redirect all domains controlled by your cPanel accounts.
3. In the *redirects to* field, enter the URL to which you would like to redirect users.
  - You must specify a protocol in this field, such as <http://>, <https://>, or <ftp://>.
4. Select whether to redirect with or without **www.** preceding the URL, using the following options:

- When you select *Only redirect with www*, only users who type **www** in front of the page name will be redirected.
  - When you select *Redirect with or without www.*, you will redirect all users regardless of whether the **www.** prefix is included with the URL.
  - When you select *Do Not Redirect www.*, users who type **www.** with the URL will not be redirected.
5. Click the *Wild Card Redirect* box if you wish to redirect all files within a directory to the same filename in the new directory.
- Example: When wild card redirects are active, if **example1.com** redirects to **example.com**, then a visitor trying to access **example1.com/pic.jpg** will be redirected to **example.com/pic.jpg**.
6. Click *Add*.
- You may test the redirect by clicking the link under *Directory* in the *Current Redirects* table. This will take you to the original domain, which should be redirected, if it is properly configured.

 **Important:** You cannot edit a redirect using this screen. If you wish to modify a redirect, you will need to delete and then recreate it.

#### Remove a Redirect

To remove an existing redirect:

1. Click the  button corresponding to the redirect you would like to remove.
2. Confirm that you would like to remove the redirect by clicking *Yes*.
  - To keep the redirect, click *No*.
